

Inventory Control

User Guide v1.0

Introduction

Welcome to the Inventory Control software. This precision stock management application is designed to keep your inventory accurate, your shelves stocked, and your purchasing decisions data-driven. It provides real-time visibility across your entire inventory, helping to eliminate stockouts and streamline reordering.

Note: This guide is based on the core feature set published for the Inventory Control application.

1. Core Features

The application provides a suite of tools to manage stock across your operations.

Feature	Description
Multi-Location Tracking	Maintain accurate stock levels across multiple warehouses, depots, or storage locations from a single interface.
Automated Reorder Alerts	The system monitors stock levels and automatically generates alerts when items reach their predefined reorder points, ensuring you never run out of critical supplies.
Stock Movement History	Every addition, removal, or transfer of stock is logged, creating a comprehensive history that aids in auditing and discrepancy resolution.
Barcode and QR Scanning	Supports barcode and QR code scanning to speed up stock checks, receiving, and dispatch processes while reducing manual entry errors.

2. Management and Visibility

Effective inventory control requires clear visibility and integration with purchasing processes.

Feature	Description
Stockout Prevention Tools	Proactive tools designed to highlight fast-moving items and potential shortages before they impact your operations.
Supplier Linking	Link inventory items directly to suppliers and purchase orders, streamlining the replenishment process when stock runs low.
Real-Time Dashboard	A central dashboard providing a real-time overview of your entire inventory status, recent movements, and active alerts.
